

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Hello committee members.

I am a resident of Bellevue, WA and have been a member of the Audubon Society for nearly 40 years. I have been an advocate for protecting forage fish for seabirds, because seabird populations are crashing. They need forage fish for their survival.

As Audubon says, 'Seabirds are in crisis. 'Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

I support the following recommendations from National Audubon. Please have the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Andrew McCormick**  
Bellevue, WA 98004

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

We all know marine life is having a harder and harder time finding food sources due to a number of factors, most controllable and created by people.

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, wasteful overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Tracy Hendershott**  
Kirkland, WA 98033

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, these missing fish are almost certainly one of the missing links in the rapid loss of the Endangered Marbled Murrelet in WA waters.

I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Marcy Golde, long time environmental and Murrelet advocate

Sincerely,

**Marcy Golde**

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds—birds that have evolved over tens of millions of years to spend most of their lives in marine environments—face significant challenges that could lead to imminent extinction. Throughout the world, seabird populations have declined by 70 percent since 1950 due to conditions HUMANS HAVE CAUSED AND CONTINUE TO TOLERATE. Every day seabirds are dying because of climate change, oil spills, overfishing, habitat loss, and (hooking and trapping) accidents involving fishing gear simply dumped into the ocean and discarded.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Melissa Rees**  
Spokane, WA 99212

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on. We need to do everything we can to protect all these important ocean species. Even the smallest ones are important.

Sincerely,

**Holly Egeland**  
Benton City, WA 99320

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

This should be a red alert on your desk everyday: Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

You must protect these little fish that seabirds rely on.

Sincerely,

**Paul Franzmann**  
Walla Walla, WA 99362

November 4, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following **SOCIALLY REASONABLE** and **RESPONSIBLE ACTIONS** actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

Because, as I'm sure you must know, the base of the food chain for seabirds, marine mammals, and larger fish like salmon, **ARE THESE VERY** forage fish and **THEY SUPPORT** the **VERY HEALTH** of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Patrick Conn**

Molalla, OR 97038

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

We humans frequently act for the short-term at the expense of the long-term.

We set aside the future concern in exchange for today's profits and industry that is unsustainable.

This hazard of narrow view and 'today' perspective

is important consideration for your Council and protecting the long-term balance of Pacific Coast Fishery is, hopefully, high on your list of missions.

Today Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

We must act to constrain the economic exploitation of resources at their expense.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

---- Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

---

Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Roger Brown**

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

BECAUSE OF US.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Treasa VanEaton**  
Portland, OR 97214

Dear Council Members:

Birds are indicator species, serving as acutely sensitive barometers of environmental health, and their mass declines signal that the earth's biological systems are in trouble. Unfortunately, this study is just the latest in a long line of such mounting evidence.

When the last tree has been cut down, the last fish caught, the last river poisoned, only then will we realize that one cannot eat money. - Native American saying

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

Portland, Oregon 97220-1384

Dear Council Members:

As a Coastal citizen, I want to beg you to protect the small fish that our wonderful shorebirds need to survive. Fishmeal is a disgusting and unnecessary product. I experienced first hand the smelly production that made coastal towns in Peru terrible places to live. There are so many better plant-based foods that could be substituted. And

already seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

**Desmond Temmer**  
Sherman Oaks, CA 91423

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

In light of your role, you are well aware of the distress that our coastal ecosystem is experiencing. I am writing to highlight, in particular, the plight of Seabirds. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries. The shortbelly rockfish population is not a sustainable resource for industry and alternative sources of protein for agriculture are available.

\* Approve the new harvest framework for northern anchovy and please act to add it to the Coastal Pelagic Fishery Management Plan. This is, after all, required by the Magnuson-Stevens Act, and it is needed to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy. And, please keep in mind that the salmon fishery stakeholders have political clout on both sides of the aisle.

Please protect these little fish that seabirds rely on. Their value as part of the ecosystem far exceeds the monetary value of commercial exploitation of this diminishing and limited resource. Commercial catches should be strictly controlled and constrained to exceptionally-low catch limits.

Thank you for your kind consideration of my plea.

Sincerely,

**Douglas Lippoldt**  
Claremont, CA 91711

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Ann Breslauer***  
Coronado, CA 92118

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To protect seabirds, it is necessary to protect the little fish that are the dietary necessity for the seabirds to exist.

These little fish are not the most glamorous for human foods, but they are what keeps the ocean ecology alive. These fish are the bottom of the food chain that is topped by marine mammals and salmon. The top cannot exist without these fish.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on. Otherwise, we're facing a 'Silent Spring' in the marine world.

Sincerely,

**Mark Zier**  
San Francisco, CA 94115

Dear Council Members:

I am writing today because seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* I strongly urge you to add a prohibition on a directed fishery for shortbelly rockfish to the groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Karen Naifeh**

The California Fish and Wildlife Agency is totally corrupt been through it first hand.

As a retired State Parks Ranger (law enforcement) who owned a ranch in the mountains of Northern California was witness to a Wildlife Biology Special Report on clear cutting of the once lush and abundant forest around our ranch state in the study by FW Biologist Joe Croteau that there was absolutely no negative effects to the wildlife and their habitats including the endangered Northern Spotted and the threatened Pacific Fisher due to the law breaking completely corrupt Sierra Pacific Industries.

The U.S. Fish and Wildlife was equally corrupt having a contract with Shasta County to kill tens of thousands of wildlife individuals just check the record.

Our coastal sea life is almost completely obliterated the sea stars and abalone almost gone and the anchovies down to 3 percent of its normal population.

Rock fish and crab and salmon also being obliterated.

These agencies need to be investigated by interviewing people on the front lines like myself but that will not happen because the system is totally corrupt controlled by criminal entities in the government agencies and their prostituted politicians.

We are heading for near term extinction soon maybe in the next decade or two as the human population skyrockets (6 billion increase in the last century alone, 2.5 to 3 billion more in the next decade or two) and our planet's ecosystem crashes.

Sincerely,

**Neil Scott**

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Sharon Paltin**  
Laytonville, CA 95454

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are still in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, over-fishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

- \* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

- \* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Richard Zoah-Henderson***

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

I hope these actions will be implemented.

We can't keep causing such huge losses to nature and wildlife or soon there will be nothing left to lose.

Sincerely,

**Jeri Opalk**  
San Jose, CA 95123

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Bill Derry**  
Edmonds, WA 98026

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Derek Benedict**  
Lynnwood, WA 98036

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Carrie Pilger**  
Lynnwood, WA 98087

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Adam Maxwell**  
Seattle, WA 98112

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Sara Burgess**

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**BARBARA Yetter**  
Seattle, WA 98125

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Sarah Poldo**  
Seattle, WA 98198

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Steven Biggio**  
Bellingham, WA 98229

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Sarah Bauman**

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Mari Declements***

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**April Watkins**  
Port Angeles, WA 98362

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**April Faires**  
Puyallup, WA 98374

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Nancy Harter**  
Olympia, WA 98501

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Barbara DelGiudice**  
Hoquiam, WA 98550

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Luan Pinson**  
Vancouver, WA 98664

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Barbara Blackwood**  
Spokane, WA 99206

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Rebecca Brown**

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Kathryn Lambros**  
Seattle, WA 98117

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Kathy Wilson**  
Port Ludlow, WA 98365

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

November 4, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jeff Kozma**  
Yakima, WA 98901

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Samantha Wilk***  
Bellingham, WA 98225

November 6, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Wendy Vanderwerf**  
Beaverton, OR 97006

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Helen Hays**  
Oregon City, OR 97045

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Kathleen Ruiz**  
Seaside, OR 97138

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jeff Martin**  
Portland, OR 97210

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Hillary Tiefer**  
Portland, OR 97219

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Tom Civiletti**  
Portland, OR 97267

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Lida Stevenson**  
Corvallis, OR 97333

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Michael Noack**  
Waldport, OR 97394

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Victor Ortega**  
Brookings, OR 97415

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Rosalie Sable**  
Medford, OR 97501

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Margaret Prag**  
Williams, OR 97544

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Stephanie Strakbein**  
Redmond, OR 97756

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***dorinda kelley***  
Portland, OR 97213

November 4, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***nancy sowersby***

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jeanne St. Pierre**  
Salem, OR 97306

November 6, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Carla Sanders**  
Rexburg, ID 83440

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Gloria D.**

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Marty Bostic**  
Los Angeles, CA 90025

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Steve Graff**

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Valerie Romero**  
Los Angeles, CA 90038

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Claudia Cataldo***  
Los Angeles, CA 90066

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Bonnie Maloney**  
Hawthorne, CA 90250

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**D. Rowe**  
Santa Monica, CA 90403

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**NATALIJA SALE**  
Seal Beach, CA 90740

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Stephaney Lloyd***  
South Pasadena, CA 91030

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Taryn Braband**  
Agoura Hills, CA 91301

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Sheryl Gustaveson***

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Alexandra Gross**  
Sherman Oaks, CA 91423

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Sandy Williams**  
Covina, CA 91723

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Ann Stratton**

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Nigella Hillgarth***  
La Jolla, CA 92037

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Anne Adams**  
San Diego, CA 92103

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Mike Kelly**  
San Diego, CA 92117

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Stephen DuPar**  
Palm Springs, CA 92262

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Alma Spaulding***  
Moreno Valley, CA 92557

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Roxanne Rummler**

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Joan Ozinga**

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Thomas McVay**  
Ladera Ranch, CA 92694

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**David Harris**  
Ventura, CA 93001

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Barbara Beatty**  
Oxnard, CA 93033

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Maureen McFadden**

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Julie Smith**  
Los Osos, CA 93402

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Elaine Eisner***

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Michael Bordenave**  
Fresno, CA 93728

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Susan Goldberg***  
Los Altos, CA 94024

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Marcus Arnold**  
San Francisco, CA 94103

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**JANE SWIGART SWIGART**

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Marcia Schmelzer***  
San Francisco, CA 94123

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Kathleen Messer***  
Alameda, CA 94501

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Lynn Locher**  
Fremont, CA 94539

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Charles Wieland**  
San Ramon, CA 94583

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Silas Andrews**  
Oakland, CA 94605

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Caryn Graves**  
Berkeley, CA 94702

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**David Silverstein**

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Nancy Lieblich***

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jill Mistretta**  
Greenbrae, CA 94904

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jeffry Anderson**  
Novato, CA 94949

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jason Demers**  
Aptos, CA 95003

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Sherrie Wren***  
Morgan Hill, CA 95037

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Barbara Polhamius**

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Tedd Kawakami***  
Stockton, CA 95204

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Kim Peterson**  
Cloverdale, CA 95425

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**robin morton**  
Sebastopol, CA 95472

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Rita Carlson**  
Eureka, CA 95502

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Sherrill Futrell Futrell***

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Nancy Polito**  
Orangevale, CA 95662

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Robert Sofio**  
Sacramento, CA 95818

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Keith Porter**  
Grass Valley, CA 95945

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Gary Warner**  
Fort Jones, CA 96032

November 3, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Jane Hunziker**  
Venice, CA 90291

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Emma Ausman***

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***John Varga***

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Cathy Halley**  
Oak View, CA 93022

November 4, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Therese DeBing**  
Pacific Grove, CA 93950

November 4, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Rika Ishii-Price***

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Stephanie Clark**  
Concord, CA 94520

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Harley Colbert**  
Richmond, CA 94804

November 4, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Karen Sommer***  
Smith River, CA 95567

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**sharon byers**  
Downey, CA 90242

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

November 5, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Stephanie Dennis**  
Lancaster, CA 93534

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**Debi Drebes**  
Perris, CA 92571

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***radha krendl***

November 7, 2021

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**James Olson-Lee**  
Sacramento, CA 95822

With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

***Emlyn Stenger***  
Englewood, CO 80113

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

Pacific Fishery Management Council  
7700 NE Ambassador Place, Suite 101  
Portland, Oregon 97220-1384

Dear Council Members:

Seabirds are in crisis. Their populations worldwide have declined by 70 percent since 1950 due to climate change, oil spills, overfishing, habitat loss, and accidentally getting hooked on fishing gear.

To ensure that seabirds on the West Coast have plenty of food to eat and to feed their chicks, I urge the Pacific Fishery Management Council and National Marine Fisheries Service to take the following actions to protect shortbelly rockfish and northern anchovy:

\* Add a prohibition on a directed fishery for shortbelly rockfish to the Groundfish Fishery Management Plan starting in 2023. With increasing global demand for fishmeal, this prohibition is necessary to prevent a new fishery from targeting shortbelly rockfish while allowing some incidental catch to allow unfettered operations of other fisheries.

\* Approve the new harvest framework for northern anchovy and add it to the Coastal Pelagic Fishery Management Plan as required by the Magnuson-Stevens Act, and to ensure durability of the management change. Due to climate change, we must carefully consider the larger ecosystem needs of birds and marine wildlife before setting catch levels on forage fish. The new framework updates the harvest control rule for this critical forage fish to ensure the condition of the stock is checked regularly, and that catch levels are set according to the health of the stock.

As the base of the food chain for seabirds, marine mammals, and larger fish like salmon, these forage fish support the health of the entire ocean ecosystem, provide coastal jobs, and impact the economy.

Please protect these little fish that seabirds rely on.

Sincerely,

**A.L. Steiner**  
Cornwallville, NY 12418
